Vektor maskide loomine kasutades QGISi

Abi kihtide lisamine

- 1) Lae alla QGIS: https://www.qgis.org/
- 2) Lisa metsaeraldiste kiht:
 - a) Layer > Add Layer > WFS API feature layer:

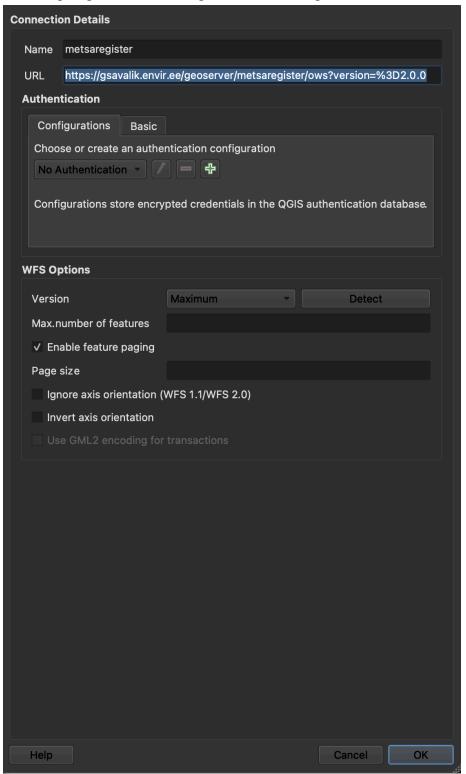

b) Lisa uus ühendus:

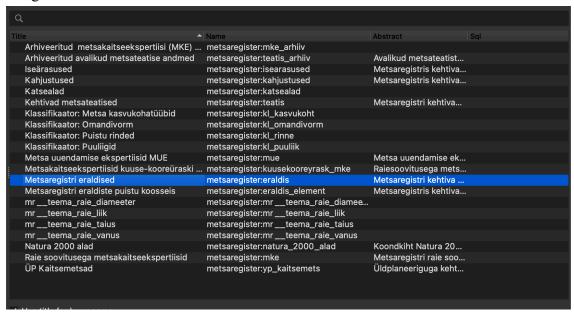

c) Lisa serveri URL ja nimi:

URL: https://gsavalik.envir.ee/geoserver/metsaregister/ows?version=%3D2.0.0

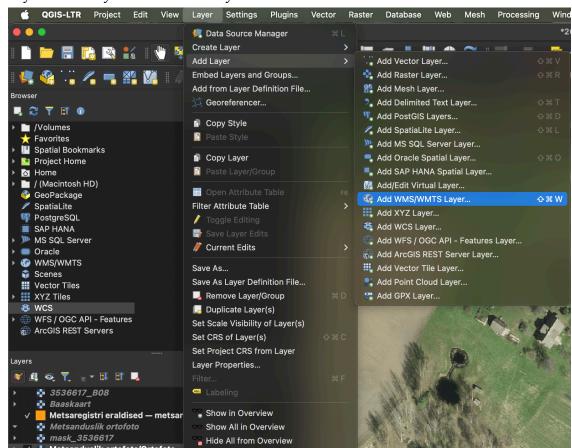

d) Vajutage connect

e) Lisage aktiivsete metsaeraldiste kiht:

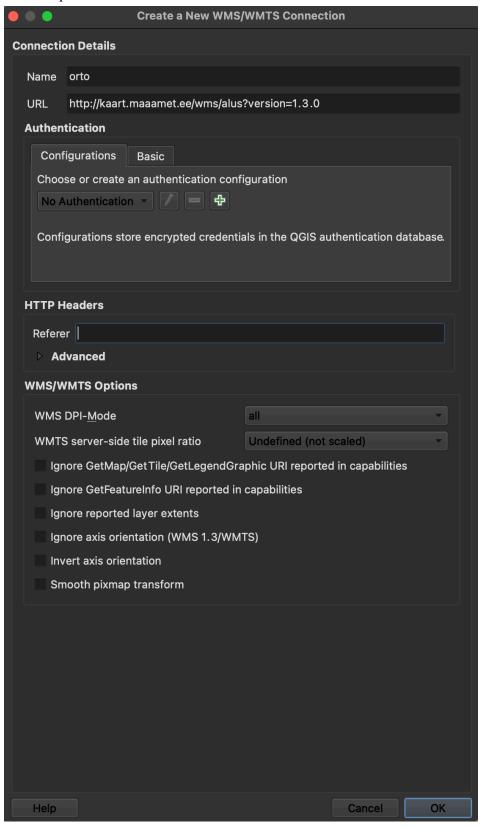

3) Lisa ortofotode kiht

a) Layer > Add layer > new WMS layer

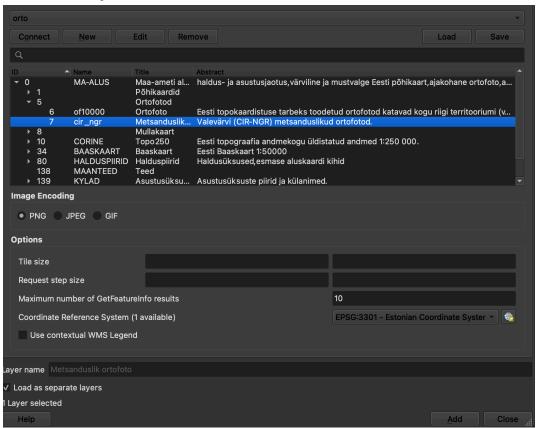

b) Lisa serveri URL ja nimi:

URL: http://kaart.maaamet.ee/wms/alus?version=1.3.0

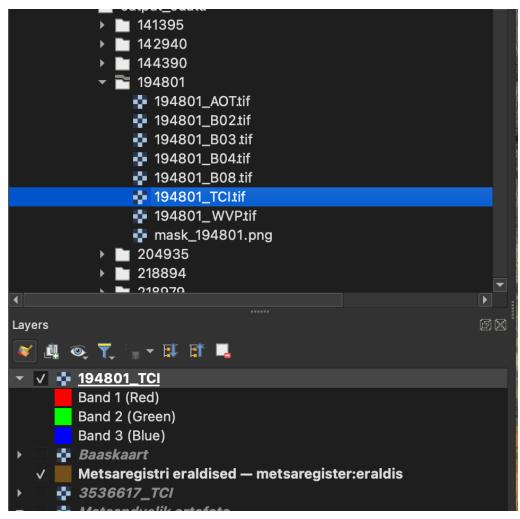

c) Saadud nimekirjast valida Metsanduslik ortofoto:

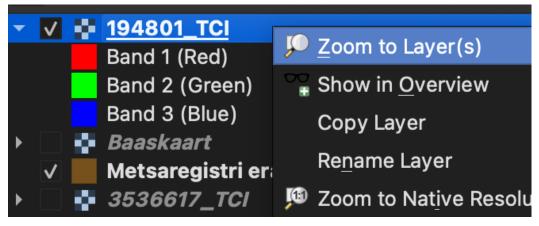

Satelliidi piltide lisamine

1) Tõsta lõigatud satelliidipildid projekti

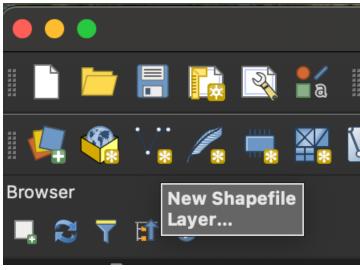

b) Et satelliidi pildile fokuseerida vajutage parem klõps pildi kihil ja valige zoom into layers:

Vektorite loomine (ehk maskide loomine)

a)

1) Loome uue shapefile, mis hakkab hoidma kõiki märgendatud polügoone:

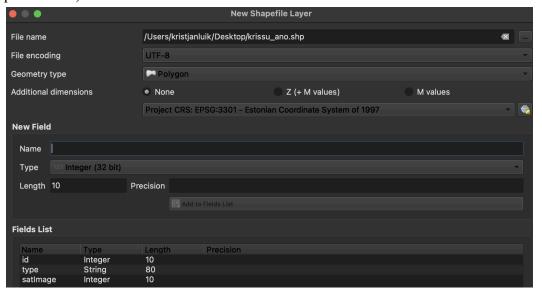

b) See sisaldab kolme välja:

a)

Field	Туре
id	Integer64
type	String
satlmage	Integer64

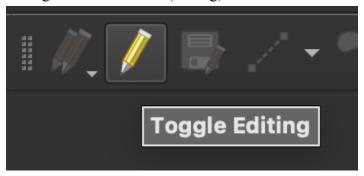

id = polügooni järjekorranumber

type = see on maski klass ja peab kuuluma ühte ("forest", "clearcut", "y_forest") satImage = lingerie ID millele see poligon kuulub (sama mis number satelliidi pildi nimes)

c)

d) Lülitage sisse töötlemine (editing):

e) Vajutage uue polügooni tegemise ikoonile:

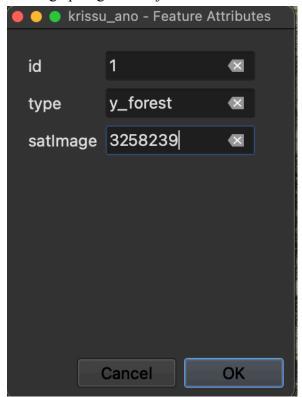

f) Looge haripunkte (vertex) millest polügoon koosneb:

(parem click et polügooni loomine lõpetada)

g) Sisestage polügooni väljad:

h) Polügoon on loodud.
